## The Trac Timeline

## Error: Macro TracGuideToc(None) failed

'NoneType' object has no attribute 'find'

The timeline provides a historic view of the project in a single report.

It lists all Trac events that have occurred in chronological order, a brief description of each event and if applicable, the person responsible for the change.

The timeline lists these kinds of events:

- Wiki page events -- Creation and changes
- Ticket events -- Creation and resolution/closing (and optionally other changes)
- Source code changes -- Repository check-ins
- Milestone -- Milestone completed

Each event entry provides a hyperlink to the specific event in question, as well as a brief excerpt of the actual comment or text, if available.

See TracIni for timeline configuration options.

## **RSS Support**

The Timeline module supports subscription using RSS 2.0 syndication. To subscribe to project events, click the orange **XML** icon at the bottom of the page. See <u>TracRss</u> for more information on RSS support in Trac.
