

Let's suppose you have installed all tools in `~/labo`. You could use this kind of script to setup your environment:

The most important part is `dsx_env.sh` which sets correct `PYTHONPATH` variable

```
export LABO=$HOME/labob
export CCTOOLS=$LABO/cctools
export SOCLIB=$LABO/soclib
export SYSTEMC=$LABO/systemc
export SYSTEMCASS=$LABO/systemcass

export PATH=$PATH:$SOCLIB/tools/bin:$CCTOOLS/bin

export DSX_DIR=$LABO/dsx
. $DSX_DIR/bin/dsx_env.sh
```
