Posix version

You may compile your application using software implementation of your tasks.

Debugging tools

You may use gdb, ddd, whatever. I wont describe it here.

Logs

Dsx will log MwMr fifos contents to files, there will appear all read/written data, from where. The file will be named after the MwMr fifo's name `name.txt`

Dsx will also log messages on terminal, and to a file named `dsx_trace.txt`. You may change minimal DsxLogging level displayed through environment variable `DSX_VERBOSITY`:

```
$ export DSX_VERBOSITY=TRACE
$ ./exe.posix
```

Or even, for a one-time change:

```
$ DSX_VERBOSITY=TRACE ./exe.posix
```
