CamelCase

New wiki links are automatically created when concatenating capitalized words, such that for example the words 'Camel' and 'Case' concatenated form a link to this CamelCase page.

CamelCase is the original wiki convention for creating hyperlinks, with the additional requirement that the capital letters are followed by a lower-case letter; hence "AlabamA" and "ABc" will not be links.

Customizing the Wiki behavior

While Trac remains faithful to the original Wiki style, it also provides a number of ways to accommodate users with different preferences:

- To prevent the creation of a link for the CamelCase word, prefix the word with an exclamation mark (!): `!CamelCase`.
- By default a CamelCase word with no corresponding Wiki page will be rendered as a gray link followed by a question mark. This is useful for example when the CamelCase style is used to name code artefacts like class names, and a Wiki page is expected to exist to document each class. The behavior can be configured through the [wiki] ignore_missing_pages option in TracIni.
- To automatically insert space characters between the words of a CamelCase link when rendering the link, enable [wiki] split_page_names of TracIni.
- Creation of explicit Wiki links is also easy, see WikiPageNames for details.
- Wiki formatting can be disabled completely in some places, for example when rendering commit log messages. See the [wiki] wiki_format_messages option in TracIni.

See TracIni for more information on the available options.
