CamelCase

New wiki links are automatically created when concatenating capitalized words, such that for example the words 'Camel' and 'Case' concatenated form a link to this <u>CamelCase</u> page.

CamelCase is the original wiki convention for creating hyperlinks, with the additional requirement that the capital letters are followed by a lower-case letter; hence "AlabamA" and "ABc" will not be links.

Customizing the Wiki behavior

While Trac remains faithful to the original Wiki style, it also provides a number of ways to accommodate users with different preferences:

- To prevent the creation of a link for the <u>CamelCase</u> word, prefix the word with an exclamation mark (!): !CamelCase.
- By default a <u>CamelCase</u> word with no corresponding Wiki page will be rendered as a gray link followed by a question mark. This is useful for example when the <u>CamelCase</u> style is used to name code artefacts like class names, and a Wiki page is expected to exist to document each class. The behavior can be configured through the <u>[wiki] ignore missing pages</u> option in <u>TracIni</u>.
- To automatically insert space characters between the words of a <u>CamelCase</u> link when rendering the link, enable <u>[wiki] split page names</u> of <u>TracIni</u>.
- Creation of explicit Wiki links is also easy, see <u>WikiPageNames</u> for details.
- Wiki formatting can be disabled completely in some places, for example when rendering commit log messages. See the [wiki] wiki format messages option in TracIni.

See <u>TracIni</u> for more information on the available options.
