Support for InterWiki links

(since <u>?0.10</u>)

Definition

An <u>InterWiki</u> link can be used for referring to a Wiki page located in another Wiki system, and by extension, to any object located in any other Web application, provided a simple URL mapping can be done.

At the extreme, <u>InterWiki</u> prefixes can even be used to simply introduce links to new protocols, such as tsvn: used by <u>?TortoiseSvn</u>.

Link Syntax

```
<target_wiki>(:<identifier>)+
```

The link is composed by the targeted Wiki (or system) name, followed by a colon (e.g. MeatBall:), followed by a page specification in the target. Note that, as for <u>InterTrac</u> prefixes, <u>InterWiki</u> prefixes are case insensitive.

The target Wiki URL is looked up in the [interwiki] section of <u>TracIni</u> or in the <u>InterMapTxt</u> wiki page, modeled after <u>?MeatBall:InterMapTxt</u>. If a prefix is defined in both the [interwiki] section and <u>InterMapTxt</u>, the [interwiki] section takes precedence.

In addition to traditional <u>InterWiki</u> links, where the target is simply *appended* to the URL, Trac supports parametric <u>InterWiki</u> URLs: identifiers \$1, \$2, ... in the URL will be replaced by corresponding arguments. The argument list is formed by splitting the page identifier using the ":" separator.

[interwiki]

Every option in the [interwiki] section in <u>TracIni</u> defines one <u>InterWiki</u> prefix. The option name defines the prefix. The option value defines the URL, optionally followed by a description separated from the URL by whitespace. Parametric URLs are supported as well.

Example:

```
[interwiki]
MeatBall = http://www.usemod.com/cgi-bin/mb.pl?
PEP = http://www.python.org/peps/pep-$1.html Python Enhancement Proposal $1
tsvn = tsvn: Interact with TortoiseSvn
```

Examples

If the following is an excerpt of the <u>InterMapTxt</u> page:

```
= InterMapTxt =
== This is the place for defining InterWiki prefixes ==
Currently active prefixes: [[InterWiki]]
This page is modelled after the MeatBall:InterMapTxt page.
In addition, an optional comment is allowed after the mapping.
----
{{{
    PEP http://www.python.org/peps/pep-$1.html  # Python Enhancement Proposal $1
```

Then,

- MoinMoin: InterWikiMap should be rendered as <u>?MoinMoin:InterWikiMap</u> and the *title* for that link would be "InterWikiMap in MoinMoin"
- Trac-ML: 4346 should be rendered as <u>?Trac-ML:4346</u> and the *title* for that link would be "Message 4346 in Trac Mailing List"
