

# reStructuredText Support in Trac

Trac supports using *reStructuredText* (RST) as an alternative to wiki markup in any context [WikiFormatting](#) is used.

From the reStructuredText webpage:

*"reStructuredText is an easy-to-read, what-you-see-is-what-you-get plaintext markup syntax and parser system. It is useful for in-line program documentation (such as Python docstrings), for quickly creating simple web pages, and for standalone documents. reStructuredText is designed for extensibility for specific application domains. "*

## Requirements

Note that to activate RST support in Trac, the python docutils package must be installed. If not already available on your operating system, you can download it at the [?RST Website](#).

## More information on RST

- reStructuredText Website -- [?http://docutils.sourceforge.net/rst.html](http://docutils.sourceforge.net/rst.html)
  - RST Quick Reference -- [?http://docutils.sourceforge.net/docs/rst/quickref.html](http://docutils.sourceforge.net/docs/rst/quickref.html)
- 

## Using RST in Trac

To specify that a block of text should be parsed using RST, use the *rst* processor.

## TracLinks in reStructuredText

- Trac provides a custom RST reference-directive 'trac' to allow [TracLinks](#) from within RST text.

Example:

```
{#{
#!rst
This is a reference to |a ticket|

.. |a ticket| trac:: #42
}}}
```

For a complete example of all uses of the *trac*-directive, please see [WikiRestructuredTextLinks](#).

- Trac allows an even easier way of creating [TracLinks](#) in RST, using the custom *:trac:* link naming scheme.

Example:

```
{#{
#!rst
This is a reference to ticket `#12`:trac:

To learn how to use Trac, see `TracGuide`:trac:
}}}
```

## Syntax highlighting in reStructuredText

There is a directive for doing [TracSyntaxColoring](#) in ReST as well. The directive is called code-block

Example

```
{{{
#!rst

.. code-block:: python

class Test:

    def TestFunction(self):
        pass

}}}
```

Will result in the below.

```
.. code-block:: python

class Test:

    def TestFunction(self):
        pass
```

## WikiMacros in reStructuredText

For doing [WikiMacros](#) in ReST you use the same directive as for syntax highlighting i.e code-block. To work you must use a version of trac that has #801 applied.

## WikiMacro? Example

```
{{{
#!rst

.. code-block:: HelloWorld

    Something I wanted to say

}}}
```

Will result in the below.

HelloWorld(Something I wanted to say)?

## Bigger ReST Example

The example below should be mostly self-explanatory:

```
{{{
#!rst
FooBar Header
=====
reStructuredText is nice. It has its own webpage_.
```

A table:

```
=====  =====  =====
      Inputs      Output
-----
      A          B      A or B
=====  =====  =====
False   False   False
True    False   True
False   True    True
True    True    True
=====  =====  =====
```

RST TracLinks

-----

See also ticket `#42`:trac:.

```
.. _webpage: http://docutils.sourceforge.net/rst.html
}}}
```

Results in:

FooBar Header

=====

reStructuredText is **nice**. It has its own webpage\_.

A table:

```
=====  =====  =====
      Inputs      Output
-----
      A          B      A or B
=====  =====  =====
False   False   False
True    False   True
False   True    True
True    True    True
=====  =====  =====
```

RST TracLinks

-----
