```

Wiki page names commonly use the CamelCase convention. Within wiki text, any word in CamelCase automatically becomes a hyperlink to the wiki page with that name.

CamelCase page names follow these rules:

1. The name must consist of **alphabetic characters only**; no digits, spaces, punctuation or underscores are allowed.
2. A name must have at least two capital letters.
3. The first character must be capitalized.
4. Every capital letter must be followed by one or more lower-case letters.
5. The use of slash (/) is permitted in page names, where it typically represents a hierarchy.

If you want to create a wiki page that does not follow CamelCase rules. you can use the following syntax:

```
* [wiki:Wiki_page], [wiki:ISO9000],
  and with a label: [wiki:ISO9000 ISO 9000 standard]
* [wiki:"Space Matters"]
  and with a label: [wiki:"Space Matters" all about white space]
* or simply: ["WikiPageName"]s
* even better, the new [[WikiCreole link style]]
  and with a label: [[WikiCreole link style|WikiCreole style links]]
```

This will be rendered as:

- Wiki_page?, ISO9000?, and with a label: ISO 9000 standard?
- Space Matters? *(that page name embeds space characters)* and with a label: all about white space?
- or simply: WikiPageName?s
- even better, the new WikiCreole link style? and with a label: WikiCreole style links?

It is possible to link to a specific *version* of a Wiki page as you would do for a specific version of a file, for example: WikiStart@1.

You can also prevent a CamelCase name from being interpreted as a link by quoting it with an exclamation mark: !CamelCase. See TracLinks#EscapingLinks.

As in the example above, you can also append an anchor to a Wiki page name to link to a specific section within that page. The anchor can be seen by hovering the mouse over a section heading, then clicking on the ¶ sign that appears at its end. The anchor is usually generated automatically, but it is also possible to specify it explicitly: see WikiFormatting#using-explicit-id-in-heading.
